ABSTRACT

The marketing of sorghum in the U.S. involves complex interregional grain movements. Moving the crop from its highly concentrated production region to points where it is used or exported requires a large transportation capacity. To provide a basis for policy and investment decisions, detailed information on sorghum movements during 1977 was collected from 3,500 grain merchandising, processing, and exporting firms in 41 states. Survey data on receipts and shipments for each state or substate area were expanded to represent total volumes for those areas and were verified by comparison with information from secondary sources. The data, which represent the most comprehensive and accurate information available on sorghum movements, are presented and summarized in this bulletin.

Keywords: Grain flows, grain shipping, grain transportation, interregional analysis, sorghum, sorghum marketing.

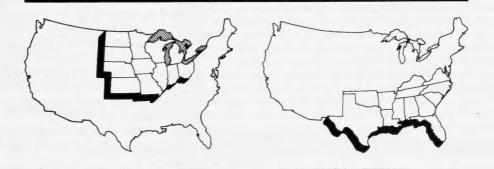

Sorghum Movements in the United States Interregional Flow Patterns and Transportation Requirements in 1977

This publication reports the results of research conducted by three regional technical committees: Southern Regional Committee S-115 on Alternative Structures for Increasing Efficiency in Intra- and Inter-regional Grain Marketing Systems; North Central Regional Committee NC-137 on Evaluation of Alternative Rural Freight Transportation, Storage, and Distribution Systems, and North Central Regional Committee NC-139 on Economic Analysis of the U.S. Grain Exporting System. The following state Agricultural Experiment Station representatives, Tennessee Valley Authority (TVA) staff members, and U.S. Department of Agriculture personnel comprised the technical committees.

Preface

The research reported in this bulletin is the first effort ever made to survey grain shippers and receivers nationwide; it is the most comprehensive study of grain movements ever conducted. Members of the technical committees, including representatives of Agricultural Experiment Stations in 25 states, assisted in conducting an industry survey to collect flow data for wheat, corn, soybeans, sorghum, oats, barley, and rye. In addition, surveys were conducted in 16 other states through contracts with 15 universities located in those states. The industry surveys were coordinated by Lowell D. Hill, Department of Agricultural Economics, University of Illinois at Urbana-Champaign. The data were tabulated and summarized under the supervision of Mack N. Leath, Economics and Statistics Service, U.S. Department of Agriculture. The success of this research project is due to the cooperation of thousands of grain marketing firms and the efforts of researchers in the many participating states.

The research was funded in part through contract DACW 72-78-C-0005 with the Institute of Water Resources, U.S. Army Corps of Engineers. Supplemental support was provided by the Federal Railroad Administration of the U.S. Department of Transportation, the Maritime Administration of the U.S. Department of Commerce, and the St. Lawrence Seaway Development Corporation. Administration of grant funds was coordinated by Lowell D. Hill, University of Illinois at Urbana-Champaign.

Sorghum Movements in the United States

Interregional Flow Patterns and Transportation Requirements in 1977

INTRODUCTION

Information about the origin and destination of grain produced in the United States and about the modes of transportation used to convey it is important for many policy and investment decisions. Although data on the quantities of grains shipped abroad from each port are available and statistics on the amount of grain shipped on the inland waterways are published annually, little information is available that can be used to match origins with destinations and to identify the mode of transportation used.

Through personal interviews with over 3,500 grain merchandisers, processors, and exporters throughout the United States, data on origins, destinations, and transport modes have now been assembled for corn, wheat, soybeans, sorghum, oats, barley, and rye. This publication summarizes the data for sorghum. Other publications in this series provide similar information for the other grains.

Sorghum is the second most important feed grain produced in the United States. Annual production has gen-

erally exceeded 700 million bushels in recent years (Table 1). During the 1970s the amount of sorghum used for human consumption declined from 3 million bushels to 1 million bushels, and the quantity used in alcoholic beverage production averaged about three million bushels annually. The amount used for seed is almost totally a function of the acreage planted; it has accounted for about 2 million bushels annually. The major domestic use of sorghum is for livestock feed. The usage for feed varies greatly from year to year in response to changes in the relative price and supply of sorghum as compared to other feed grains. The annual usage for feed generally exceeded 500 million bushels during the 1970s. The most dramatic growth in the demand for sorghum has been in the export markets. Export shipments of sorghum increased from 123 million bushels in 1971-72 to an estimated 350 million bushels in 1979-80

Sorghum requires a large volume of transportation because it is grown in a highly concentrated production area and because the very large export demand is focused on only a few ports on the Gulf of Mexico. The production of sorghum is concentrated in the Southern

Great Plains where rainfall is usually inadequate for corn and soybean production (Figure 1). The area of concentrated production extends from southern Nebraska to the Texas gulf coast. The leading states in sorghum production are Kansas, Missouri, Nebraska, and Texas (Table 2). In 1977 these four states produced 688 million bushels of sorghum, 87 percent of the total U.S. production. About 32 percent of all the sorghum produced in the nation was used for feed and seed on the farms where it was produced, and about 62 percent was sold from farms.

PURPOSE OF STUDY

Analysis of grain flow patterns can reveal the geographical nature of grain markets and the type of transportation services required by the grain industry. This information is useful to grain firms in identifying additional marketing opportunities and in making decisions about where to locate new handling, storage, and processing facilities. Of equal importance is the value of this information to those who set federal and state transportation policies. The formulation of rational grain transportation policies depends upon knowledge of existing grain flows and associated transportation modes. In many situations, firms or public agencies make decisions affecting the production, storage, and transportation of grain without adequate information about grain distribution patterns and the demands that those decisions will place on the various transportation modes. The objectives of this study were:

- 1. To determine the volume of sorghum moving between various origins and destinations
- To determine the extent to which the various transportation modes are employed in the movement of sorghum in the U.S.

METHODOLOGY

For the purposes of this study, the United States was divided into 132 numbered regions and 31 ports, as shown in Figure 2. Data from the 31 ports were aggregated into 13 port areas located in four major export regions. The specific ports included in each port area are listed with their identifying numbers in Table 3. Sorghum flow data were collected for the 1977 calendar year primarily through personal interviews with representatives of grain handling, storage, and processing firms in 41 states. The firms from which data were obtained included country elevators, inland terminal elevators, river terminal elevators, feed manufacturers, export elevators, commercial feedlots, and processing

firms. A representative from each state's Agricultural Experiment Station was responsible for drawing the sample and conducting the interviews.

The sampling of inland grain elevators in the particular state was carried out by listing the elevators in descending order of storage capacity. Starting with the largest, elevators were added to the sample until the total of their storage capacities was equal to at least 25 percent of the inland elevator storage capacity in that state. Not less than 10 percent of the remaining elevators were then selected at random. For river elevators the procedure was simpler: a minimum of 50 percent of the elevators were selected by random sampling.

Feed manufacturing firms in each state were arrayed on the basis of their production capacity. Starting with the largest, feed firms on the list were added to the sample until the total of their production capacities equalled or exceeded 10 percent of the total feed manufacturing capacity in the state. Ten percent more of the remaining firms were then selected at random and included in the sample. All exporters and processors were included in the interviews.* Data based on random samples were expanded in proportion to the sampling rate to convert the data into estimates for the entire region or state.

The same types of information were gathered from all the grain handlers and processors interviewed. Each firm was asked to identify the volume of grain that it received from each region and the volume that moved by each mode of transportation. The firms were also asked to identify each region or port area for which their shipments were destined and the quantity shipped by each mode.

Experiment Station representatives verified the accuracy of the data collected, expanded the sample data to state totals, and delivered the summary data for each grain and for every substate region to the U.S. Department of Agriculture for processing. As receivers' and shippers' data were tabulated, the Experiment Station representative in each state checked any discrepancies to identify potential data errors and to arrive at a single number for each origin-destination pair. Insofar as possible, the state representatives checked data to ascertain that they were consistent and logical.

VERIFICATION OF DATA

The accuracy of the data on the volume of sorghum shipped between the various origins and destinations by each mode of transportation was verified by several direct and indirect comparisons with data from other sources. One indirect check was made by adding receipts to the surplus or deficit† to obtain the supply

available for shipment from each state. Exact correspondence between the supply and reported shipments was not expected since the data on sorghum consumption by livestock and processors were based on estimates. Any major discrepancies, however, were investigated to verify that they did not indicate significant errors in the survey data.

A second check on total volume was made by comparing total receipts at each port with official data on inspections for export as published by the Market News Service of the U.S. Department of Agriculture (Table 4). Because there were few opportunities for either set of data to miss significant volumes, these numbers compared very closely. Discrepancies between receipts and exports at some of the port areas were explained by shipments to domestic destinations from export elevators, shipments to processing plants located in the port area, and changes in inventory.

Supplemental information about grain shipments on inland waterways was provided by the U.S. Army Corps

^{*} Only one major processor did not provide data for the study. Data on receipts by that firm were estimated from information furnished by shippers.

[†] The surplus or deficit for each state was calculated by adding the 1977 production to the stocks in all positions as of January 1, 1977, then subtracting the amount used for livestock, processors, and seed and deducting the stocks in all positions as of January 1, 1978.

of Engineers. Since these data were based on the actual bill of lading for each shipment they were, in principle, a complete census of all barge shipments. As Table 5 shows, the survey data and the Corps data on state-tostate shipments on inland waterways correspond closely. Differences between the two sets of data can be explained by (1) a significant number of shipments for which the origins and destinations are noted as "unknown" in the Corps data, (2) changes in the destination of a barge after it left the loading dock, (3) incomplete reporting of loadings to the Corps of Engineers, and (4) reporting errors by survey respondents. The sizeable shipments from Minnesota in the Corps data suggest that errors may be present in recording the type of grain being shipped since sorghum is not produced in that state.

The last method of validation provides important insight into data available from the U.S. Department of Transportation that are based on a 1 percent sample of all rail bills of lading. These data were expanded to develop estimates of annual shipments and receipts in each state and then compared with the rail shipments reported by survey respondents (Table 6). There are many similarities, but there are also a few major differences. In Nebraska, for example, intrastate shipments were seriously understated in the 1 percent waybill sample.

The comparisons between various data sources increase the confidence in the accuracy of estimates derived from sampling a less than perfectly identified population. The logic of each flow reported in these tables has been checked by the university person that organized the survey in each state. Where internal inconsistencies were found, the data and the sampling rates were adjusted with assistance from grain specialists and industry personnel in the state. The flow esti-

OVERVIEW OF MOVEMENTS

This section summarizes selected data and presents a general overview of sorghum movement patterns. Detailed data on receipts and shipments for each region are presented in the last section of this bulletin.

Shipments and Receipts by State

In 1977, grain marketing firms in the United States reported shipping about 671 million bushels of sorghum. About 60 percent of the amount shipped moved to destinations within the state in which it originated. Much of the total amount, of course, is accounted for by the same grain being shipped in sequence by several firms. Intrastate shipments for each state and mode of transportation are summarized in Table 7. Trucks were the predominant mode of transportation, accounting for about 58 percent of the total intrastate shipments. Rail shipments accounted for 38 percent of the total amount shipped, and 4 percent moved to local farmers. A sizeable portion of the intrastate movements consisted of shipments from country elevators to terminal elevators for storage and reshipment. Movements within the state of Texas accounted for more than one-half of the total volume of intrastate movements in the United States. Sizeable movements also occurred within the states of Kansas and Nebraska.

In contrast to intrastate movements, the predominant mode of transportation used for interstate shipments was the railroad, which carried 217 million bushels or 83 percent of the total volume (Table 8). Almost three-fourths of the volume moving by railroads originated in Kansas and Nebraska. Kansas, Texas, and California were the principal destinations for shipments originating in Nebraska. Texas and California were the principal destinations for Kansas's rail shipments, and Arkansas, Missouri, and Arizona were also important destinations. Over 5 million bushels moved by rail from Kansas to each of these states.

Interstate truck movements originating in Kansas accounted for almost one-half of the volume shipped across state lines by truck. Most of these shipments moved short distances to the neighboring states of Missouri, Oklahoma, and Texas, where some of the grain was used by feed processors and the balance was stored and later reshipped to port areas.

Barges carried only 3.3 percent of the sorghum shipped across state lines, and Arkansas, Illinois, and Missouri originated 81.5 percent of the total volume shipped in the U.S. by barge. All sorghum shipped by barge, regardless of the state in which it originated, was destined for Gulf Ports.

The volume of sorghum received in each state from other states is shown in Table 9. Texas port areas were the predominant destinations. Arizona and California were the most important domestic markets in the West while Arkansas and Louisiana were important domestic markets in the South. The domestic flow pattern for sorghum is illustrated in Figure 3.

Movements to Ports

Table 10 shows the amount of sorghum that moved to port locations from each of the originating states by the various modes of transportation. Almost one-half of the volume of sorghum that moved to ports originated in Texas, and the Gulf region accounted for 98.5 percent of the total amount received by all ports. Over 64 percent of the sorghum shipped to ports went by rail. Nebraska, Kansas, and Texas were the states that shipped the largest volume of sorghum by rail for export, accounting for over 85 percent of the total amount of sorghum shipped to the port regions. Missouri shipped a significant amount by rail and ranked fourth among all states that originated sorghum rail shipments to port regions. Thirty-two percent of the sorghum shipped to port regions went by truck. Texas was the state that shipped the largest amount by truck, accounting for almost 94 percent of the 79 million bushels that moved by truck to ports. Less than 9 million bushels were shipped by barge to port regions, and over one-half of this volume originated in Missouri. These movements are illustrated in Figure 4.

Each state's share of the total volume of sorghum shipped to port regions is shown in Figure 5. Texas was

the state that shipped the greatest amount of sorghum for export, accounting for 48.6 percent of the total amount shipped. Nebraska and Kansas shipped significant volumes, ranking second and third, respectively, among all states that originated sorghum shipments to port locations. Combined, these two states accounted for almost two-fifths of the total volume moving to port locations.

The estimated amount of sorghum received at all port areas in 1977 totaled 243 million bushels, of which 227 million bushels were inspected for export (Table 11). The remainder was either processed or represented increases in sorghum stocks at port elevators during 1977. Over 98 percent of sorghum exports were handled by Gulf port elevators, and the North Texas Gulf was the predominant port area, accounting for 56 percent of the total volume exported. The South Texas Gulf area ranked second on the basis of volume, and over 91 million bushels were handled through those facilities in 1977.

Foreign Destinations for U.S. Exports

Sorghum shipped from the various origins to a specific port area is blended and stored on a commingled basis. Thus it is not possible to trace the movement of

^b Includes 2,780,000 bushels shipped by rail to Mexico.

sorghum from a particular state through the port system to its final destination, and therefore no attempt was made to determine whether a particular ocean vessel was loaded with, for example, Kansas sorghum or Texas sorghum. It is nonetheless of interest to examine one more link in the market chain that connects U.S. farmers with foreign feeders and processors.

The destination countries for sorghum exported from the major port regions of the United States are shown in Table 12. In 1977 Japan was the leading buyer of U.S. sorghum, accounting for 89 million bushels or 39 percent of the total volume exported. Israel, Mexico, Portugal, and Spain were the next most important destinations and in combination purchased about the same quantity as Japan. Venezuela and Columbia were major destinations in South America, and sizeable quantities were shipped to European countries.

Data on receipts and shipments for individual state and substate areas delineated in the survey are presented in the following section.

RECEIPTS AND SHIPMENTS BY AREA

Estimates of the flow of sorghum by each mode of transportation and for every area are presented in Tables 13-115. These estimates represent the most comprehensive and best data available on the volume of sorghum transported between each of the regions of the United States.

A detailed study of the flows will likely lead some readers to the conclusion that there are inefficiencies in the shipment of grain among states. Shipping sorghum in both directions between two states is one example of an apparent inefficiency in the marketing pattern. However, most of the shipments reported in this study reflect sellers' attempts to take advantage of profitable marketing opportunities that occur at a particular moment. It is not possible to provide a rationale for all of the movements without complete knowledge of daily price and transportation relationships. Local supply and demand vary throughout the marketing year, and buyers constantly seek the most economical supply source. Changes in supplies, demands, and transportation costs result in frequent changes in the most profitable shipping pattern.

The availability of storage space at harvest time is also an important factor in determining sorghum shipments. If local storage facilities are filled with wheat when sorghum moves from the farms, country elevators may be forced to ship sorghum to various terminal locations such as Kansas City for storage. If these movements are by rail under transit rates, then this grain is committed to moving to domestic and export points beyond the terminal location. Later in the year, available supplies in the local region may be exhausted, and feed mills and livestock feeders in that area will begin purchasing sorghum from outside sources, reversing the earlier outbound flow. Many other factors, such as the availability of transportation, have a substantial impact on sorghum movements. An inadequate supply of rail cars during periods of peak movement may force sorghum to flow in a pattern that would not otherwise be the most economical. A detailed analysis of the influence of these factors is beyond the scope of this publication. Readers interested in more detailed information about the type of firms involved in sorghum movements and the seasonality of these movements should contact Agricultural Experiment Station representatives in the participating states.
